2022-01-27

1. `calc_influence_nearest`:
 - Add support for multiple zoi input values
2. `calc_influence_cumulative`:
 - implement `exp_decay` and `Bartlett` without the need to use `create_filter` (embed it)
 - implement function within GRASS
 - make example for GRASS
 - test time for different implementations in GRASS (`r.resamp.filter`, `r.mfilter`)
 - not so important: implement Gaussian with parameters based on zoi
3. `create_filter`:
 - implement Gaussian filter parameterized on zoi
4. All functions:
 - Possible: standardize parameters (method, type, transform, including “euclidean” as an option for nearest)
5. `calc_influence`:
 - implement for R and GRASS
6. `simulate_dist_dens` - with terra - not important
7. Implement calculation using buffers around points instead of the whole map
8. Data:
 - add a layer to the package, for testing (cabins, describe it)
